Abstract (en)

[origin: WO0237999A1] The invention concerns a wheeled suitcase structure, comprising a telescopic handle (3) housed in at least a vertical tube (2). The vertical tube (2) opposite the handle (3) is secured on one side of a shell-shaped or box-shaped bottom element (1) opening upwards. The base of said bottom element is provided, on the same side, with at least two lateral recesses (6) for receiving the wheels. The bottom and at least two portions of the side walls form the shell and is designed to constitute an exposed lower portion, or provided with a soft cover, of the suitcase. The telescopic housing tube (2) comprises, at an upper level, a fixing element adapted to fix and support at least partly the upper or rear surface of the suitcase. The bottom element (1) is preferably open along an inclined plane relative to the tube (2):
