Abstract (en)
[origin: WO0242115A1] The present invention relates to a system for the transport of a plurality of vehicles (3, 4) comprising: a freight container (100); a separate three-dimensional transport frame (1) with sides (1c, 1d) that form between them a receiver space (2) for the vehicles (3, 4), said transport frame (1) being configured for being able to be conveyed into and out of the freight container (100); and carrier devices (70) configured for supporting the vehicles (3, 4) at the front (3', 4') and rear (3'', 4'') wheel axles, respectively, of the vehicles (3, 4) between the sides (1c, 1d) of the transport frame. The invention is characterised in that the transport frame (1) comprises, along each side (1c, 1d), at least two substantially horizontal, longitudinally extending carrier beams (30) that are arranged at a first height and a second height, and that extends between a first end (1a) and a second end (1d) of the transport frame (1); and that the carrier beams (30) are configured for being able to support said carrier devices (70) and for allowing a displacement of the carrier devices (70) between the first end (1a) and the second end (1d) of the frame (1).
