Abstract (en)

[origin: WO0242591A1] The invention relates to a window winding arm device for a motor vehicle, comprising a first lever arm (5) which is positioned in a pivoting manner on a pivoting axis (100), a drive unit (2) which interacts with the first lever arm (5) by means of an output element (3), and a second lever arm (4) which is connected to the first lever arm (5) in a pivoting manner by means of an articulated axis (300) which is at a distance from the pivoting axis (100). Said second lever arm (4) has a longer side (410), and a shorter side (420) opposite the same. The inventive device also comprises a slideway (12) in which a supporting axle (120) located on the shorter side (420) of the second lever arm (4) is guided. The inventive window winding arm device is characterised in that it is weight-saving and compact, and can be easily built in to a motor vehicle.
