Abstract (en)

[origin: WO0245031A1] The enclosure (V) comprises a communication interface (ICV) with outside, means for processing (IDV, OCV) and means for transferring (OMV) the content and/or data concerning said content (C). The processing means (IDV, OCV) establish an authenticating function with homologous authenticating means (IDK) of a key (K) provided with at least an access right, via the communication interface (ICV) of the enclosure and an homologous communication interface (ICK) of the key (K). In case of positive authentication and positive verification of access right, the processing means of the enclosure (IDV, OCV) command the locking/unlocking means (SDV) to open the door (P). When the door is opened, the processing means of the enclosure (IDV, OCV) transfer the content and/or the content-related data derived from the transfer means of the enclosure (OMV) to the key of the enclosure, via the communication interface (ICV) of the enclosure and the homologous communication interface (ICK) of the key (K).
