Abstract (en)
[origin: WO0237435A1] The invention concerns smart card (CP) comprising a descriptor (DAP) of an application (AP) consisting of several distributed remote elements with descriptors (DIU, DAGm, DSEm) of the elements, and a bootstrap (PI) for deploying the application for example in the card host terminal (TE). The application can be partly deployed in accordance with one or several states based on the card context and user. An application state may comprise, at least one or all the elements of the application. In general, the application comprises the descriptor (DAGm) of at least an element qualifying at least a process and the descriptors (DIU, DSEn) of a user interface and of at a least data server. The invention also concerns the selective deployment of the application.
