Abstract (en)
A method for pre-processing speech in particular for a method for recognizing speech is suggested in which likelihoods (L_j , LM_{total} , L) for occurrences for speech elements (P_1, \dots, P_m) based on acoustic feature data (AFD) is suggested, wherein before deriving said likelihoods (L_j , LM_{total} , L) parts of said acoustic feature data (AFD) being representative for frequency bands (F_1, \dots, F_N) which are assumed to be distorted by an additive and band-limited noise signal (NS) are exchanged by exchange feature data (EFD) so as to generate modified acoustic feature data (MAFD), said exchange feature data (EFD) being representative for undisturbed and/or average speech. <IMAGE>
