Abstract (en)
[origin: EP1340857A1] A retaining structure of mechanically stabilised earth obtained by means of the insertion of reinforcement elements (6, 8) extending perpendicularly to the external vertical surface of the retaining wall and equipped with a front facing composed of panels (1-3) preferably prefabricated in reinforced concrete, to which the reinforcement elements (6, 8) are secured by means of an anchorage system (5, 7). The said reinforcement elements (6, 8) are composed of substantially bidimensional layers and are, in particular, polymer geogrids or geotextiles for geotechnical applications, and at least some of the said layers (6, 8) extend as loops from one level of earth to the above one, by rising vertically on the back of the said front facing panels (1-3), or along the rear part of the said reinforced earth structure, opposite the front facing. <IMAGE>
