Abstract (en)
[origin: EP1340953A2] The heat exchanger consists of a cylindrical housing (2) with a first medium flowing through it axially, while a second medial passes round it through a spiral corrugated hose (3) with separate connections (6, 7) for the second medium. The hose has its end sectors (12, 13) serving as separate insertion connections for the second medium extending from outside and passing through the housing to the inside.
