Abstract (en)

[origin: WO0245777A1] The invention concerns a data transmission device consisting of a loop encoding antenna integrated in one of the elements constituting the weighing system (1) equipped with an oscillating weighing tray (6) whereon is urged to be fixed a blood bag support (10) wherein is set a blood bag (13) whereon is fixed an electronic chip (12) provided with a loop antenna (43). Thus, the encoding antenna (15) is integrated in the wall of the blood bag (13) support and is connected by a cord (19) to the computer device associated with the weighing system (1). The data concerning sampling are first collected at said computer device and transferred into the electronic chip (12) before the blood bag (13) is removed from the blood bag support (10) thereby eliminating any risk of error in transmission of data concerning sampling, subsequent to blood sampling.
