Abstract (en)

Disclosed is a method of controlling a heating operation in an air conditioner enabling rapid supply of heating air to cope with the demanded temperature at the early stage of operation. An air conditioner including a compressor, a first heat exchanger, a second heat exchanger, a refrigerant, a first blow fan at a side of the first heat exchanger, a second blow fan, and a wind-direction control member, includes a power heating mode supplying a heating air by varying a blow quantity of the refrigerant, an airflow, and the wind direction in accordance with an operation time so as to raise room temperature quickly and clear a room temperature difference fast and a normal heating mode supplying the heating air with a uniform airflow and a uniform wind direction until a user-requested temperature is attained.
