Abstract (en)  
[origin: WO0250367A2] The method is used for continuously impregnating textile materials in an impregnation compartment containing the impregnating liquor, the textile material being fed through said compartment, wherein the impregnating liquor contains a lye or a lye and additionally an oxidative bleaching agent as impregnating agent. Part of the impregnating liquor is branched off via a bypass (2, 2a), filtered and then fed to one or more sensors (17, 21) to determine the concentration of the impregnating agent. The branched-off part of the impregnating liquor is heated before it is filtered. Continuous, uninterrupted and a precise post-dosing of the impregnating agent is achieved.
