Abstract (en)

[origin: WO0242681A1] The invention relates to a support for an interface such as a computer display. The invention consists of a hinge (7), which is attached to a basis (3). A sliding member (2) is attached to the hinge (7) and a translational member (1) is attached to the sliding member (2). A rotational member (14) is attached to the translational member (1). By means of these elements of the support, it is possible within certain boundaries to adjust the vertical height, the lateral placement, the orientation and the inclination of the interface to suit any users needs or demands.
