Abstract (en)  
[origin: EP1344883A1] The bolt (4) of the locking device can be moved into the extended position selectively by means of a motorised drive (2) or closing cylinder (7). The motorised drive is mounted next to the main lock (1) and is connected through coupling means (23) to the slider (9). The coupling means (23) have a free area (27) in which the slider can move without entrainment of the motorised drive. The free area with the motorised drive in the basic position is dimensioned to enable the slider (9) to move into its two positions. The slider is connected directly to the drive rod (3).
