Abstract (en)

[origin: EP1345284A2] The device has two clamp parts (4,5) clamped to the rail (3) by a lateral connecting element (6) when fitted. The first clamp part and connecting element are designed so that starting from a pre-assembly state in which the clamp parts are in loose contact with the rail, a pivoting motion of the first clamp part towards the rail is achieved in addition to clamping movement of at least this part towards the rail by operating the connecting element.
