Abstract (en)

[origin: WO02051689A1] The invention concerns a device for clamping a system adjusting the position of an element (30) relative to a support assembly (6). The element (30) is arranged inside two vertical posts (11, 12) of the support assembly (6). The clamping axis (5) is perpendicular to the two posts. The device comprises: a bracket (20) consisting of a base plate (21) and two tie rods (22, 23) which are linked by an element (56) for closure and support on the post (12), and external clamping rod (19) arranged on the base plate (21) and whereon are mounted: a locking assembly (40); an intermediate element (50) for support on the post (11) arranged between the base (21) and the locking assembly (40); an assembly for axial retention (47) of the locking assembly (40) which is adjusted to obtain the clamped and unclamped positions.
