Abstract (en)
[origin: WO02051713A1] The invention relates to a reservoir (1) comprising a receiver container (3) having an upper extraction opening (2), and a cover (4) which can be placed over said opening in order to close the same. Said cover is detachably fixed to the receiver container in the closed position (5). The aim of the invention is to improve one such reservoir in such a way that the cover is fixed to the receiver container in a constructive and easy-to-handle manner. To this end, an actuation element (8) is positioned on the cover in such a way that it can pivot between a locking and unlocking position (6, 7), and is moveably connected to at least one locking element (9, 10). Said locking element can engage with an engagement element (11, 12) arranged on the receiver container, in order to pivot the actuation element between the unlocked and the locked position.
