Abstract (en)
[origin: WO0249979A1] The invention concerns a method for making a multilayer product comprising an inorganic substrate in particular of glass, said substrate being successively treated as follows: sensitizing with a tin coating, then deposition of an adhesion promoter selected from the family of mercaptosilanes having a double bond; then coating with an inorganic product such as a metal coating. The invention is characterised in that the promoter enhances adhesion between the inorganic substrate and can be selected from the family of mercaptosilanes having a double bond.
