Abstract (en)

[origin: WO0250360A1] The pressing of shirts on a shirt-shaped inflation body (1) is carried out to advantage, by tensioning the shirt in a flat arrangement. According to the invention, tensioning means are thus fixed to flat sections of the envelope (2) of the inflation body (1), which draw the flat sections (3) inwards, or prevent said sections from adopting a round form on inflation. Said tensioning means (4) can be for example, flexible tensioning strips, connecting opposite regions of the envelope (2) together and furthermore, can partition those regions (8, 9) in which a reduced air flow occurs as a result of the thermal insulation.
