Abstract (en)
[origin: WO0244961A1] The invention relates to a terminal device (e.g. mobile telephone), memory module (e.g. smart card), method and system for distributing electronic content (e.g. music, games, movies etc.), to the terminal according to predetermined tailoring information. The memory module is releasable and attachable from the terminal device and stores the predetermined tailoring information concerning what electronic content is to be transferred. The terminal device transmits the tailoring information to a network element (e.g. an access point in a short range RF communication system), which transmits the electronic content to the terminal device, according to the tailoring information.
