Abstract (en)

[origin: WO02052678A1] An antenna device is designed for incorporation in an electric apparatus and has a radiator carried by a flexible plastic film (2). The film has a radiator pattern (3) disposed on one side of a configurationally stable plastic carrier (1), and also a supply conductor (4) which extends to the opposite side of the carrier (1). The carrier has snap catches (5) for securement direct on the circuit card, and a resilient portion (6) with a projection (13) directed towards the circuit card. The supply conductor (4) covers the projection (13) and thereby realises contact, galvanically and under spring pretensioning, with a contact point, a so-called pad, on the circuit card.
