Abstract (en)

The present invention relates to a rotary tool for chip removing machining, for example a milling cutter or a drill, the tool comprising a shaft, a conical seating (10) arranged in the shaft (1), which seating is situated in connection to one end of the shaft (1), a holder (3) having an externally generally conical portion, a cutting part (5), the holder (3) having members (14) for receipt of the cutting part (5), as well as members (9, 11) in order to apply a force on the holder (3) in the axial direction of the shaft (1). Separately, the invention also relates to a cutting part (5). <??>The tool according to the present invention is characterized in that the holder (3) has a slightly conical recess (14), that the cross-section dimension of the recess (14) decreases in the direction of the open end of the recess (14), that the cutting part (5) has a slightly conical pin (20), which is designed to be received in the recess (14), that the cross-section dimension of the pin (20) increases in the direction of the free end of the pin (20), and that the recess (14) has a flexible shape. <IMAGE>
