Abstract (en)

[origin: WO0251193A1] The present invention relates to a method for determining a zone of interest within a specific area for monitoring and generating an action when a positioned mobile station (MS) approaches a boundary of said zone of interest, in a system comprising means for obtaining a position of said MS, a client terminal and a Service Provider Station (SPS). The method comprises the steps of: accessing said SPS through a communications network by said client terminal, retrieving and accessing a geographically related information set over said specific area from said SPS, providing a boundary for at least one zone of interest with respect to said geographically related information set, converting said boundary into a geographically corresponding area, and monitoring said area corresponding to said boundary for said zone.
