Abstract (en)

A plurality of connecting bodies are formed in various shapes of a resilient material such as molded plastic or other resilient material. The connecting bodies each define a plurality of inwardly extending slots which form receiving mechanisms for the edge portions of a plurality of cooperating generally planar plate members. The plate members are assembled to form more complex structures utilizing the connecting bodies to form interconnection therebetween. In alternate embodiments, a complex structure for the inwardly extending slots includes flexible ribs on each side of the slots together with relief slots adjacent the ribs. In further alternate embodiments, the connecting bodies and plate members may be assembled to form complex fanciful figures utilizing specialized elements such as a fanciful head member which bears a fanciful face and leg elements.
