Abstract (en)

The present invention relates to a process for the preparation of a coating composition, in particular for protecting surfaces from undesired contamination and facilitating removal of the contamination from these surfaces, a combination of a wet lacquer and a powder lacquer being applied to the surface, which combination comprises a primer, as well as tetrafluorethylene polymer and/or polyfluoroxide. This composition can be used for many applications, in particular for the protection of surfaces of suspension and support organs that are used during high-pressure spray operations, like painting or cleaning.
