Abstract (en)

[origin: WO0248008A1] The invention concerns a device left in garments for obtaining identical folding dimensions to provide homogeneous and aesthetic stacks having on their front part garments folded with perfect round-off. It consists of a base body (1) forming two plates (2) and (3), articulated in (8) and (9) about a half-cylinder (4) inserted in the groove (12). The garment is folded by folding down its panels one by one on the plates (2) and (3) and then the plate (2) on the plate stop (3). The inventive device is particularly designed to fold garments for storing them in identical and aesthetic stacks on shop shelves.
