Abstract (en)

[origin: WO0214862A2] The invention relates to a method for characterising and/or for detecting a bonding complex comprising the following steps: providing a first bonding partner and a conjugate from a second and a third bonding partner and providing a fourth bonding partner; forming a link between the bonding partners, wherein the first bonding partner combined with the second bonding partner forms a sample complex and the third bonding partner combined with the fourth bonding partner forms a reference complex; applying a force to the link, which results in the separation of the sample complex or reference complex; determining which of the bonding complexes were separated.
