Abstract (en)

[origin: WO0246822A1] The invention refers to a device for aiming objects at a distance from a user of the device, including a first part (4) arranged to receive a bundle of light beams along an aiming line (5), which form an optical image of the viewed object, a reflecting member (12) provided to be hit by said bundle from the first part (4) and to reflect at least a primary part of the light of said bundle, and a second part (8), which includes an ocular member (9) enabling to a user to view the object along the aiming line (5). The device includes an electronic image-receiving member (14), which is arranged to receive said reflected part and convert it to an electric signal and which image-receiving member (14) is connectable to an electronic image-processing unit (15), which includes a memory member (17) arranged to store said electric signal in an electronic manner.
