Abstract (en)

[origin: EP1350753A1] A release mechanism is operable through a governor rope (6) to prevent unwanted engagement of the safety gear. The release mechanism has a lock that retains the release mechanism in an unreleased position, and an auxiliary rope brake (15) that acts on the governor rope. The brake provides a force to activate the release of the release mechanism in an emergency overspeed condition. An overspeed governor (5) triggers the stop of the elevator by engagement of the safety gear in an overspeed condition.
