Abstract (en)

Comprises the following elements: A latch assembly (3) that comprises a beveled end (6) with a prismatic extension (7), joined onto an auxiliary part (13) on the upper wing (15), leaving the assembly pressed by a latch spring (17) that stops on a tab (18). A shutter assembly (4) that comprises a shutter (19) and a balancing beam (28) capable of introducing itself in front of the lower wing (15). A bolt assembly (5) that comprises a lever (30) that can be blocked by a flange (32) of an oscillating stump (33). <??>The antipanic function is initiated by turning a follower plate (39) whose finger (40) initially lifts an oscillating blockage (45) to remove the latch assembly (3) afterwards, while simultaneously, a catch hook (42), articulated on a follower plate (39), lifts the oscillating stump (33) to remove the lever (30) afterwards, by turning on a fixed pin (47).
