Abstract (en)  
[origin: WO02058939A1] The invention relates to an ink pad for a self-inking stamp, comprising a housing having a support frame (1') and a stamp plate carrier (3) which can be revolved in said housing from a resting position to a stamping position, and which is connected to an actuating handle (2) which can be moved in relation to the housing against a return spring. Said ink pad (6) can be introduced into a receiver (8) of the housing by means of an essentially cradle-shaped pad holder (7), and a sealing frame (9) extends over the circumference of the pad holder, said sealing frame comprising a sealing lip (9') which projects from the pad holder. When the pad holder is in the user position in the receiver of the stamp housing, said sealing lip elastically deforms and comes into contact with the stamp plate carrier in a sealing manner.
