Abstract (en)

[origin: WO02053492A1] A process and apparatus for steam reforming of hydrocarbons, using a sulfur-tolerant catalyst comprising an active phase and a support phase, and optionally a promoter, which provides substantially complete conversion of the hydrocarbon to a mixture of hydrogen, carbon monoxide, and carbon dioxide. The process comprises introducing steam and a hydrocarbon feed containing at least about 2 ppm sulfur species into the apparatus, and reacting said steam and hydrocarbon feed in the catalyst bed.
