Abstract (en)
The feeding bottle, comprising a body and a teat held in place by a retaining ring (16), especially threaded and engaging with the bottle neck (4), has a non-return valve (26) between the bottle and teat, and a progressive air inlet formed by a radial channel (38) in the rim of the bottle neck and the edge of the valve, and controlled by a lip (40) on the teat collar (14). The size of the air inlet is varied by adjusting the pressure applied to the flexible edge of the teat collar by the threaded ring according to the flow rate required by the baby.

Abstract (fr)
Ce biberon comprend un corps, une tétine, ainsi que des moyens de fixation, notamment par vissage (16), de la tétine sur le corps. Il est prévu des moyens de passage d'air en direction d'un volume intérieur (V) de ce corps, la tétine étant mobile entre une position de libération de ces moyens de passage d'air et une position d'obturation, au moins partielle, de ces moyens de passage d'air, de manière à faire varier progressivement le débit d'air s'écoulant en direction de ce volume intérieur. <IMAGE>
