Abstract (en)

[origin: EP1355028A2] A panic-opening system for doors comprises at least one spring latch (3), which is able to oscillate, by means of a slide (12) that is able to translate as a result of the displacement of a push-type control bar (2), between an extracted position, in which it engages a stationary blocking striker (4), and a retracted position for releasing the mechanism for push-opening of the door (1). An anti-intrusion security device (17, 18) prevents oscillation of the spring latch (3) towards its retracted position in the advanced condition of the slide (12).
