Abstract (en)  
[origin: EP1355378A1] The device has 2 mutually engaging parts, one with a holder for correct cable insertion, the other with a contact pin(s) per cable wire that penetrates the insulation when the parts are assembled. The holder is wider than the cable in the transverse direction. An adapter part is inserted into the holder to define the cable's lateral position. A further contact pin in the other part engages a wire or the adapter part depending on cable position. The device consists of two mutually engaging parts (14,24), one with a holder (20) for correct insertion of the cable (3) and the other with at least one contact pin (15,15a) per cable wire that penetrates the insulation when the parts are assembled. The holder is wider than the cable in the transverse direction. An adapter part (25) is inserted into the holder to define the lateral position of the cable and a further contact pin is provided in the other part to engage a wire (5,6) or the adapter part depending on the cable position.
