Abstract (en)

[origin: WO02057575A1] The invention relates to an electronically controllable closing device for all types of doors and gates. Said closing device consists of a lock (1) and a handle (2) by which means at least one bolt (3) can be displaced by acting on the closing mechanism of the lock (1) which is fitted with the at least one bolt (3). The inventive device is characterised in that a coupling (4) is arranged between the handle (2) and the lock (1), said coupling producing or releasing the connection between the handle (2) and the at least one bolt (3) by means of a command by electric signals.
