Abstract (en)

[origin: WO02063170A1] The invention relates to a pump system having a hydraulic pump (1) comprising an actuator (13) influencing the pumping capacity, which can be supplied with signals from a regulating unit and a control unit (18) for actuation thereof. The regulating unit and control unit can receive input signals which represent the state and operational variables of a consumer (5) and/or a dynamic system, wherein the user is integrated. The actuating signals can be produced and supplied to the actuator according to a functional context stored in the regulating and control unit according to said input signals.
