Abstract (en)
[origin: WO02061331A1] The invention relates to a light comprising a carrier element (2) for a longitudinal lamp, and longitudinal light influencing means (3) which are to be fixed on the carrier element (2). Said light contains at least one fixing element (6) which is provided on the light influencing means (3) and which can be longitudinally displaced between a locking position and an unlocking position. Said fixing element comprises catch projections which engage in catch recesses (13) of the carrier element (2) when the fixing element (6) is in the locking position, thus fixing the light influencing means (3) to the carrier element (2). Said fixing element (6) is provided with at least one spring arm (7) which bends outwards and comprises a catch (12) which is oriented towards the carrier element (2) and forms the catch projection. An inclined ramp (17) is also arranged on the spring arm (7), said ramp co-operating with a stop on the light influencing means (3) in such a way that the spring arm (7) is bent out into the unlocking position during the displacement of the fixing element (6). The assembly of the light influencing means (3) is thus simplified.
