Abstract (en)  
[origin: DE10105463A1] Known climbing frames comprising a support frame in which a rope net is rigged up are not very attractive as individual playing devices as there is no considerable 3-dimensional net volume, and the device cannot be combined by modular construction to form larger units. According to the present embodiment, the support frame consists of at least one pentagonal frame element, a separate rope net being fixed inside each frame element. The frame elements can thus be assembled in a modular manner to form complex 3-dimensional structures.
