Abstract (en)
[origin: WO02055005A1] A massage device for massaging a body part of a person in an unsupervised and unattended setting is provided. In a preferred embodiment, the massage device comprises an inflatable garment (200) having a plurality of inflation bladders (250), to apply pressure to the body part, and an inflation assembly (300) includes a manifold (324) into which the pressurized fluid flows, a plurality of inflation valves (326) which control the flow of fluid from the manifold to the bladders, and a manifold valve for controlling the maximum pressure level within the bladders. The inflation assembly may have a predetermined inflation capacity which defines a maximum bladder size as well as an array in which the bladders are arranged. The massage device may further comprise a connector for connecting tubes from the bladders to the inflation assembly, wherein the connector includes a garment-identifying component for identifying the type of garment connected to the inflation assembly.
