Abstract (en)
[origin: FR2820722A1] The invention concerns a closure cap comprising a terminal transverse wall (3) and a cylindrical skirt (4) including, on its inner surface, a thread designed to co-operate with a complementary outer thread of a container neck. The closure is designed to receive a moulded joint (15) extending substantially on the entire inner surface (16) of the transverse wall (3), over a substantially constant thickness. The transverse wall (3) comprises, on its inner surface (16), at least a projection (17) forming catching means for the joint (15), thereby ensuring retention of the joint (15) against the transverse wall (3). The axial height of the projection (17) is less than the thickness of said joint (15).
