Abstract (en)
[origin: WO02064474A1] The superstructure of a folding machine comprises a former for feeding a plurality of adjacent partial webs of material into the folding machine. A longitudinal separating device for separating a basic web of material into several partial webs of material is mounted in the former. A perforating device for producing a longitudinal perforation in the basic web of material can be arranged in front of the former in such a way that the longitudinal separating device separates the basic webs of material along the perforation.
