Abstract (en)
[origin: EP1362981A1] Recesses (10,11), in the surfaces of the building parts forming the joint-formed cavities, are pressed out after joining the building parts by materials, which are fluid to viscous at the time of their injection, and then change into an elastic or elastoplastic state. The cavities are pressed out after primary deformations of the building parts. For pressing out the cavities, plastics, especially thermoplastic elastomers are used which are liquefied for injection by heat. An Independent claim is also included for a unit used for carrying out the method.
