Abstract (en)

[origin: WO02064332A1] A method and device for cutting food, especially frozen salmon filet, into several slices. A feeder device is used to convey the foodstuff to be cut to a cutter (21) by means of transport wheels (22). The central area of said foodstuff is thicker than the edges thereof. The feeder device (20) is pivoted in relation to a cutting plane of the cutter (21) during the cutting process, whereby the angle of adjustment (  $\alpha$  ) between the feeder device (20) and the cutting plane is modified. The feeder device (20) is pivoted during cutting, moving from an initial lowered position to a raised intermediate position before moving downwards from the raised intermediate position into a lowered final position. The feeder device is pivoted according to the position of the foodstuff in the feeder device (20), which is detected by means of a sensor, especially a light scanner. .
