Abstract (en)
[origin: US2004150236A1] The invention relates to a hawk, which comprises a surface for applying a material, in particular a filler, and a handle. To provide a hawk, which is ergonomically designed such that even relatively long working with the hawk is possible, it is proposed in the scope of the invention that the handle on the underside of the hawk is designed with an essentially L-shaped cross-section. By this means it becomes possible to hold the hawk by means of two fingers, which are inserted laterally into the handle, it thereby being possible, by virtue of the natural clenching tendency, to hold the hawk without quickly becoming tired. In a further development of the invention, the handle has a T-shaped cross-section.
