Abstract (en)  
[origin: WO02072366A1] A storage device (800, 900, 1000) for retaining one or more sheet items (12) for access by a user. In one embodiment, the storage device (800, 900, 1000) includes a storage device cover (16) having at least front and rear panels (18, 20). One or more first binding members (32) are associated with the storage device cover (16) and extend through apertures (14) formed in the sheet items (12) to register the sheet items relative to the cover (16). One or more second binding members (38) are hingedly connected to the storage device cover (16) and preferably operate independently of the front and rear panels (18, 20) of the cover (16) to engage the first binding members (32). Retained sheet items (12) are able to be moved from a first position lying generally parallel with the rear panel (20) to a second position distant therefrom.
