Abstract (en)  
[origin: US6785650B2] Generally, the present invention provides the ability to present a mixed display of a transcription to a user. The mixed display is preferably organized in a hierarchical fashion. Words, syllables and phones can be placed on the same display by the present invention, and the present invention can select the appropriate symbol transcription based on the parts of speech that meet minimum confidences. Words are displayed if they meet a minimum confidence or else syllables, which make up the word, are displayed. Additionally, if a syllable does not meet a predetermined confidence, then phones, which make up the syllable, may be displayed. A transcription, in one aspect of the present invention, may also be described as a hierarchical transcription, because a unique confidence is derived that accounts for mixed word/syllable/phone data.
