Abstract (en)
[origin: WO02073800A1] The aim of the invention is to achieve an improved adaptation of a filter that operates with acoustic waves. To this end, the invention provides a transducer structure in which the distances between each two adjacent electrode fingers of an interdigital transducer (IDTV) vary over the length of the transducer. The variation preferably follows a continuous distribution function. Reactance filters that are equipped in the serial branch with such resonators exhibit an improved electrical adaptation in the passband.
