Abstract (en)
[origin: WO02074454A1] The invention relates to a screening panel comprising screening elements which are arranged next to each other and which are detachably fixed to steel profile sections of a supporting structure by means of a separate profiled section made of plastic and which is mounted inbetween the screening elements. The plastic profiled section and the screening elements have corresponding engaging profiles which are held in a positive fit by fixing means which can be inserted from the top into the plastic profiled section. The plastic profiled section also has a base profile which can be engaged into the steel profile of the supporting structure. The plastic profiled section is embodied in the form of a profiled strip. The fixing means is embodied as a wedge strip and the engaging profiles are continuous in form. The upper area of the wedge has a continuous, groove-like recess which is open towards the top and the side walls thereof surrounding the engaging profiles are elastic, at least in the direction leading towards each other.
