Abstract (en)

[origin: WO02074629A1] The invention relates to a device for bundling a stack (02) of sheet-type objects comprising a supporting plate (06) for the stack (02) and a banderole (01) intersecting between the surface of the supporting plate (06) and an underside of the stack (02). A channel (07) is formed in the supporting plate for pushing the banderole (01) through the stack. The supporting plate (06) can be pushed through a shaft (26) formed between two lateral defining walls (27) in order to bend the banderole (01) between the defining walls (27) and the lateral walls of the stack (02) counter to the lateral surface. A tongue (09) is displaceable between a retracted position, wherein it separates the channel (07) from the surface of the supporting plate (06), and a withdrawn position, wherein it the channel (07) is placed in an open position with respect to the surface of the supporting plate (06).
