Abstract (en)

[origin: DE10112795A1] In a knitwear manufacturing process to monitor the consumption of yarn from different sources, the yarn feeds to active knitting systems (1-2) from several non-positive supply units (S,E,R) using two different feed systems. The individual yarn measure ( $m_1\text{-}mn$ ) is continually monitored using rotational signals ( $S_1\text{-}S_n$ ) measured at the supply units (S,E,R). Also claimed is an assembly which compares the individually measured quantities of yarn ( $m_1\text{-}mn$ ) with corresponding target values ( $m_1'\text{-}mn'$ ) derived from a masterpiece. The information is used to adjust machine settings within pre-defined tolerance settings matched to the yarn quality parameters. The information is presented at a computer interface with process control panel. The computer holds hosiery production data relating to the different types of yarn and supply processes.
